ZCash protocol

Implementation of the Decentralized Anonymous
Payment scheme Zerocash

Objectives

ProVerif model faithful to the specification

Verification of several security properties

- Balance
- Non-malleability
- Ledger indistinguishability

Following the specification

Zcash Protocol Specification

Version 2020.1.15 [Overwinter+Sapling+Blossom+Heartwood+Canopy]

Daira Hopwood[†]

Sean Bowe[†] – Taylor Hornby[†] – Nathan Wilcox[†]

November 6, 2020

Following the specification

5.4.6.2	Binding Signature	68
5.4.7	Commitment schemes	68
5.4.7.1	Sprout Note Commitments	68
5.4.7.2	Windowed Pedersen commitments	68
5.4.7.3	Homomorphic Pedersen commitments	69
5.4.8	Represented Groups and Pairings	70
5.4.8.1	BN-254	70
5.4.8.2	BLS12-381	71
5.4.8.3	Jubjub	73
5.4.8.4	Hash Extractor for Jubjub	74
5.4.8.5	Group Hash into Jubjub	74
5.4.9	Zero-Knowledge Proving Systems	75
5.4.9.1	BCTV14	75
5.4.9.2	Groth16	76
5.5	Encodings of Note Plaintexts and Memo Fields	77
5.6	Encodings of Addresses and Keys	78
5.6.1	Transparent Addresses	78
5.6.2	Transparent Private Keys	79
5.6.3	Sprout Payment Addresses	79
5.6.4	Sapling Payment Addresses	80
5.6.5	Sprout Incoming Viewing Keys	80
5.6.6	Sapling Incoming Viewing Keys	81
5.6.7	Sapling Full Viewing Keys	81
5.6.8	Sprout Spending Keys	81
5.6.9	Sapling Spending Keys	82
5.7	BCTV14 zk-SNARK Parameters	82
5.8	Groth16 zk-SNARK Parameters	83
5.9	Randomness Beacon	83
6	Network Upgrades	83
7	Consensus Changes from Bitcoin	85
7.1	Transaction Encoding and Consensus	85
7.2	JoinSplit Description Encoding and Consensus	88
7.3	Spend Description Encoding and Consensus	89
7.4	Output Description Encoding and Consensus	89
7.5	Block Header Encoding and Consensus	90
7.6	Proof of Work	92
7.6.1	Equihash	92
7.6.2	Difficulty filter	93
7.6.3	Difficulty adjustment	93
7.6.4	nBits conversion	95
7.6.5	Definition of Work	95
7.7	Calculation of Block Subsidy, Funding Streams, and Founders' Reward	95
7.8	Payment of Founders' Reward	96

7.9	Payment of Funding Streams	98
7.9.1	ZIP 214 Funding Streams	99
7.10	Changes to the Script System	99
7.11	Bitcoin Improvement Proposals	100
8	Differences from the Zerocash paper	100
8.1	Transaction Structure	100
8.2	Memo Fields	100
8.3	Unification of Mints and Pours	100
8.4	Faerie Gold attack and fix	101
8.5	Internal hash collision attack and fix	102
8.6	Changes to PRF inputs and truncation	103
8.7	In-band secret distribution	104
8.8	Omission in Zerocash security proof	105
8.9	Miscellaneous	105
9	Acknowledgements	106
10	Change History	107
11	References	126
Appendices		137
A	Circuit Design	137
A.1	Quadratic Constraint Programs	137
A.2	Elliptic curve background	137
A.3	Circuit Components	138
A.3.1	Operations on individual bits	138
A.3.1.1	Boolean constraints	138
A.3.1.2	Conditional equality	139
A.3.1.3	Selection constraints	139
A.3.1.4	Nonzero constraints	139
A.3.1.5	Exclusive-or constraints	139
A.3.2	Operations on multiple bits	139
A.3.2.1	[Un]packing modulo r_g	139
A.3.2.2	Range check	140
A.3.3	Elliptic curve operations	142
A.3.3.1	Checking that Affine-ctEdwards coordinates are on the curve	142
A.3.3.2	ctEdwards [de]compression and validation	142
A.3.3.3	ctEdwards \leftrightarrow Montgomery conversion	142
A.3.3.4	Affine-Montgomery arithmetic	143
A.3.3.5	Affine-ctEdwards arithmetic	144
A.3.3.6	Affine-ctEdwards nonsmall-order check	145
A.3.3.7	Fixed-base Affine-ctEdwards scalar multiplication	145
A.3.3.8	Variable-base Affine-ctEdwards scalar multiplication	146
A.3.3.9	Pedersen hash	147

Ledger

Limitation

Global consensus on the ledger

Limitation

Tree structure of ledger not represented

Entries of the commitment trees in a table (set)

```
(* The memory cell [size_tree] will contain the current number of elements
contained in the tree. *)
free size_tree:channel [private].

(* The anchor is modeled by applying the private function on the number of elements
in the tree. Note that the modeling only works with a unique, global treestate.
*)
fun gen_anchor(nat):t_J [private]. (* Root of Merkle Tree *)
fun gen_pos(nat):random.           (* Position in the Merkle tree *)
fun gen_path(nat):random.         (* Path in the Merkle tree *)

table commitment_trees(nat,identity,random,random,t_J).
```

Verify transaction (Insert)

```
in(size_tree,cur_size:nat);
in(0_insert,tr:bitstring);    (* The transaction *)
...
Verify spend descriptions
...
Verify output descriptions with two note commitments:
cm_o1, cm_o2
...
Verify Balance
...

let path_o1 = gen_path(cur_size+1) in
let pos_o1 = gen_pos(cur_size+1) in
let path_o2 = gen_path(cur_size+2) in
let pos_o2 = gen_pos(cur_size+2) in

insert commitment_trees(cur_size+1,id, path_o1, pos_o1, cm_o1);
insert commitment_trees(cur_size+2,id, path_o2, pos_o2, cm_o2);

out(size_tree,cur_size+2);
```

Limitation

Two inputs, Two outputs

Ledger

Entries of the nullifier sets by events

(Test « not in table » badly handled by ProVerif)

```
event UniqueNullifier(bits_256, identity, stamp).
```

Use restriction to encode check of nullifier

```
(* Excludes traces that contain two UniqueNullifier with the same nullifier [nf] *)  
restriction nf:bits_256, st1, st2:stamp, id:identity;  
  event(UniqueNullifier(nf, id, st1)) &&  
  event(UniqueNullifier(nf, id, st2)) ==>  
  st1 = st2.
```

Verify transaction (Insert)

```
in(size_tree, cur_size:nat);  
in(0_insert, tr:bitstring);    (* The transaction *)  
...  
Verify spend descriptions with two nullifiers nf_i1, nf_i2  
  
new t1:stamp;  
event UniqueNullifier(nf_i1, id, t1);  
new t2:stamp;  
event UniqueNullifier(nf_i2, id, t2);  
  
...  
Verify output descriptions with two note commitments:  
cm_o1, cm_o2  
...  
Verify Balance  
...  
  
let path_o1 = gen_path(cur_size+1) in  
let pos_o1 = gen_pos(cur_size+1) in  
let path_o2 = gen_path(cur_size+2) in  
let pos_o2 = gen_pos(cur_size+2) in  
  
insert commitment_trees(cur_size+1, id, path_o1, pos_o1, cm_o1);  
insert commitment_trees(cur_size+2, id, path_o2, pos_o2, cm_o2);  
  
out(size_tree, cur_size+2);
```

Modeling cryptographic primitives

Hash functions and PRF

Perfect one-way function

```
fun h(bitstring):bitstring.
```

TOO STRONG

CRH^{ivk}, Mixing Pedersen Hash

Collision resistant, not second-image resistant, not unlinkable

DiversifyHash

Unlinkable, not collision resistant

SigHash

Unlinkable, not second-image resistant

Modeling cryptographic primitives

Adds equations and destructors to model primitives weaknesses

Not collision resistant

```
fun coll_a(bitstring):t_input.  
fun coll_b(bitstring):t_input.  
  
equation forall x:bitstring; h(coll_a(x)) = h(coll_b(x)).
```

Linkable

```
fun isLinked1(t_output,t_output) : bool  
reduc forall x:t_input1, y:t_input2, z:t_input2; isLinked1(h(x,y),h(x,z)) = true.  
  
fun isLinked2(t_output,t_output) : bool  
reduc forall x:t_input2, y:t_input1, z:t_input1; isLinked2(h(y,x),h(z,x)) = true.
```

4 levels of security

Basic

Weak (Linkable, etc)

Collapse (to a single value)

Inversible

Limitation

Best effort

Modeling cryptographic primitives

Signature weaknesses

Dennis Jackson, Cas Cremers, Katriel Cohn-Gordon, and Ralf Sasse. Seems legit: Automated analysis of subtle attacks on protocols that use signatures.

No Conservative Exclusive Ownership

```
fun CE0gen(t_sig): t_prv.  
  
fun validate(t_pub,t_msg,t_sig) : bool  
  reduc  
    forall x:t_prv,y:t_msg,r:random; validate(derive_public(x),y,i_sign(x,y,r)) = true  
  otherwise  
    forall x:t_prv,y:t_msg,r:random; validate(derive_public(CE0gen(i_sign(x,y,r))),y,i_sign(x,y,r)) = true.
```

Destructive Exclusive Ownership, Collision signatures...

Modeling cryptographic primitives

Binding signatures and balance

Ideally

Limitation

No arithmetic

In our model: only swap possible

Oracle processes

Followed the « oracle-style » from cryptographic games

Eli Ben Sasson, Alessandro Chiesa, Christina Garman, Matthew Green, Ian Miers, Eran Tromer, and Madars Virza.
Zerocash: Decentralized Anonymous Payments from Bitcoin.

Create address

Generates new honest agents with their spending key (sk) and unbounded number of payment addresses (d, pkd).

Mint

Bootstrap some coins and adds them to ledger. Only honest agent can mint.

Pour

Enforce honest agents to compute a transaction spending and creating coins.

Insert

Receives a transaction from attacker and adds it to ledger if valid.

Oracle processes

Create address

```
channel O_ca.  
  
let CreateAddress =  
  (* Honest Agent Creations *)  
  new sk:t_sk;  
  new sk_PubId:pubID;  
  (* Public pointer to a secret key (notably used by the  
  adversary) for instructing honest transactions. *)  
  out(O_ca,sk_PubId);  
  insert spendingKeys(sk_PubId, sk, IDstorage);  
  
  ! (* Generate set of (d,pkd) revealed to the attacker *)  
  new d:t_d;  
  let pkd: t_KA_pub_key = d0Fsk(d, sk) in  
  new pkd_PubId:pubID;  
  
  out(O_ca,(pkd_PubId,d,pkd));  
  insert paymentAddresses(pkd_PubId, pkd, d, sk, IDstorage)  
.
```

Insert

```
channel O_insert.  
  
let Insert =  
  in(O_insert, tr:bitstring);  
  
  (* Verify the unique transaction *)  
  in(size_tree,cur_size:nat);  
  
  if verifyTransaction22(cur_size,IDstorage,tr) then  
    (* This will add the created note commitments and spend  
    nullifiers to the treestate. *)  
    out(size_tree,cur_size+2)  
  else  
    out(size_tree,cur_size)  
.
```

Security properties

- Non-malleability
- Balance
- ~~Ledger indistinguishability~~

Non-malleability

The attacker cannot produce a transaction tr sharing a nullifier with a different honest transaction tr' with tr valid except for the shared nullifier already in the nullifier set.

Non malleability

Obtained from the attacker

Obtained from Pour oracle

```
let checkMalleability(id:identity, tr:bitstring, tr':bitstring) =  
  
...  
  
if tr <> tr' then  
  
(** Check that tr and tr' spend the same nullifier (for the first coin they spend). *)  
if nf_i1 = nf_i1' then  
  
(** Verify the spending/output descriptions *)  
let verifyZK_i1: bool = ... in  
let verifySign_i1: bool = ... in  
...  
let verifyZK_o2: bool = ... in  
  
(** Verify balance *)  
let verifyBalance: bool = isBalance22(bindSig, sig_hash, cv_i1, cv_i2, cv_o1, cv_o2) in  
  
if verifyZK_i1 && verifySign_i1 && verifyZK_i2 && verifySign_i2 && verifyZK_o1 && verifyZK_o2 && verifyBalance  
then  
  if nf_i2 = nf_i2'  
  then event transactionIsMalleable  
  else  
    (** Verify that the second nullifier is unspent if different *)  
    if check_and_insert_nullifier(id, nf_i2) then  
      event transactionIsMalleable
```

```
query event(transactionIsMalleable) ==> false.
```

Balance

$$\text{Ideally: } v_{\text{unspentA}} + v_{\text{A}\rightarrow\text{H}} \leq v_{\text{H}\rightarrow\text{A}}$$

Sum of unspent
adversary coins

Sum of adversary coins
sent to honest agents

Sum of honest coins
sent to adversary

Balance

$$\text{Ideally: } v_{\text{unspentA}} + v_{\text{A}\rightarrow\text{H}} \leq v_{\text{H}\rightarrow\text{A}}$$

Sum of unspent adversary coins

Sum of adversary coins sent to honest agents

Sum of honest coins sent to adversary

Balance

Ideally: $v_{\text{unspentA}} + v_{\text{A} \rightarrow \text{H}} \leq v_{\text{H} \rightarrow \text{A}}$

Sum of unspent adversary coins

Sum of adversary coins sent to honest agents

Sum of honest coins sent to adversary

$v_4 + v_2 \leq v_2 + v_4$

Results

	Balance	Malleability
BASIC	✓	✓
WEAK	✓	✓
INV	✓	✓
COLLAPSE	✗	✓
BROKEN_PRF	✓	✗

✗ : ProVerif could not prove (does not necessarily mean attack)

✓ : proved

What's next ?

Ledger indistinguishability

Weaken ledger consensus hypothesis

Allow more than value swapping

Allow more than 2 in / 2 out in transactions
